Soil is a mixture of organic matter, minerals, gases, liquids, and organisms that together support life. Earth's body of soil, called the pedosphere, has four important functions: as a medium for plant growth; as a means of water storage, supply and purification; as a modifier of Earth's atmosphere; as a habitat for organisms; All of these functions, in their turn, modify the soil and its ...

TMF soils are quite different from tropical lowland soils. On tropical mountains, the often reddish-brown loamy lowland soils on flat plains become replaced by more yellowish, acid and peaty soil types with organic upper horizons on steep slopes in rugged terrain. TMF soils are frequently water-logged and suffer from podsolization, a soil-forming process, which causes the leaching of nutrients ...

J.L. Boettinger, in Encyclopedia of Soils in the Environment, 2005. Alluvial Soils. The morphological, physical, chemical, and mineralogical properties of alluvial soils depend greatly on the characteristics of the alluvial parent material in which the soils formed, especially when the soils are young. As alluvial soils develop with time, the other soil-forming factors influence the resulting ...

Maintaining good soil quality is crucial for the sustainability of agriculture. This study aimed to evaluate the effectiveness of the visual soil assessment (VSA) method by testing it on two soil types and two agricultural management practices (AMP) (organic and integrated) that are considered to protect soil quality. We selected two farms with plots on two river terraces with different soil ...

Soil pH provides various clues about soil properties and is easily determined. The most accurate method of determining soil pH is by a pH meter. A second method which is simple and easy but less accurate than using a pH meter, consists of using certain indicators or dyes. Many dyes change color with an increase or decrease of pH making it possible to estimate soil pH. In making a pH ...
